

Hydraulic mould holder

Categories: [Screw presses access.](#)

FTB's mould holder systems have quick change with manual/mechanical or hydraulic clamping.

INFO: The mechanical clamping is effective but clearly more time-consuming (manual tightening of screws), while the hydraulic clamping is fully mechanised and therefore faster and more efficient. The mould can be quickly clamped/unclamped by means of a simple button, while having the guarantee of predefined centring and a self-locking system, which is faster and safer (prevents centring and clamping errors). FTB can customise the mould holders to the customer's **moulds**, and adapt them to different types and sizes.
